1 PRODUCT OVERVIEW

Module is an extended remote distributed IO module that supports S7TCP over Siemens Ethernet Protocol connection to PLC; PLC (without any programming) can be accessed directly through the corresponding register address module to support the PLC.

It has SMART200/300/1200, and also supports the conversion between Modbus RTU and Modbus S7TCP

The IO point of slave module connected through Modbus RTU is transferred to S7TCP, which can be accessed by PLC directly through register address

The module also supports MODBUS TCP Server, Modbus RTU Slave Station, Modbus RTU Master Station, Modbus RTU Master Station

- 8-way photoelectric isolation digital input, 8-way relay digital output (corresponding to the number of status indicator)
- 6-way 12-bit analog input, 1-way 12-bit analog output
- 2 way 485 interface, 1-way DB9 master, 1-way terminal, independent use
- RJ45 port, 10/100 Mbps Ethernet communication
- With baud rate, station number dial switch, easy to set module parameters
- Support S7TCP client protocol, can be directly used as the Siemens Ethernet PLC Expansion Module.
- Modbus supports Modbus TCP, Modbus and TCP protocols, as well as 4 Modbus TCP connections
- The system has built-in Modbus TCP to Modbus RTU, Modbus RTU to Modbus TCP; it can be used as TCP network server or client
- It supports converting up to 6 Modbus RTU slave stations and this module into 1 Modbus TCP server control corresponding to the number of configuration points

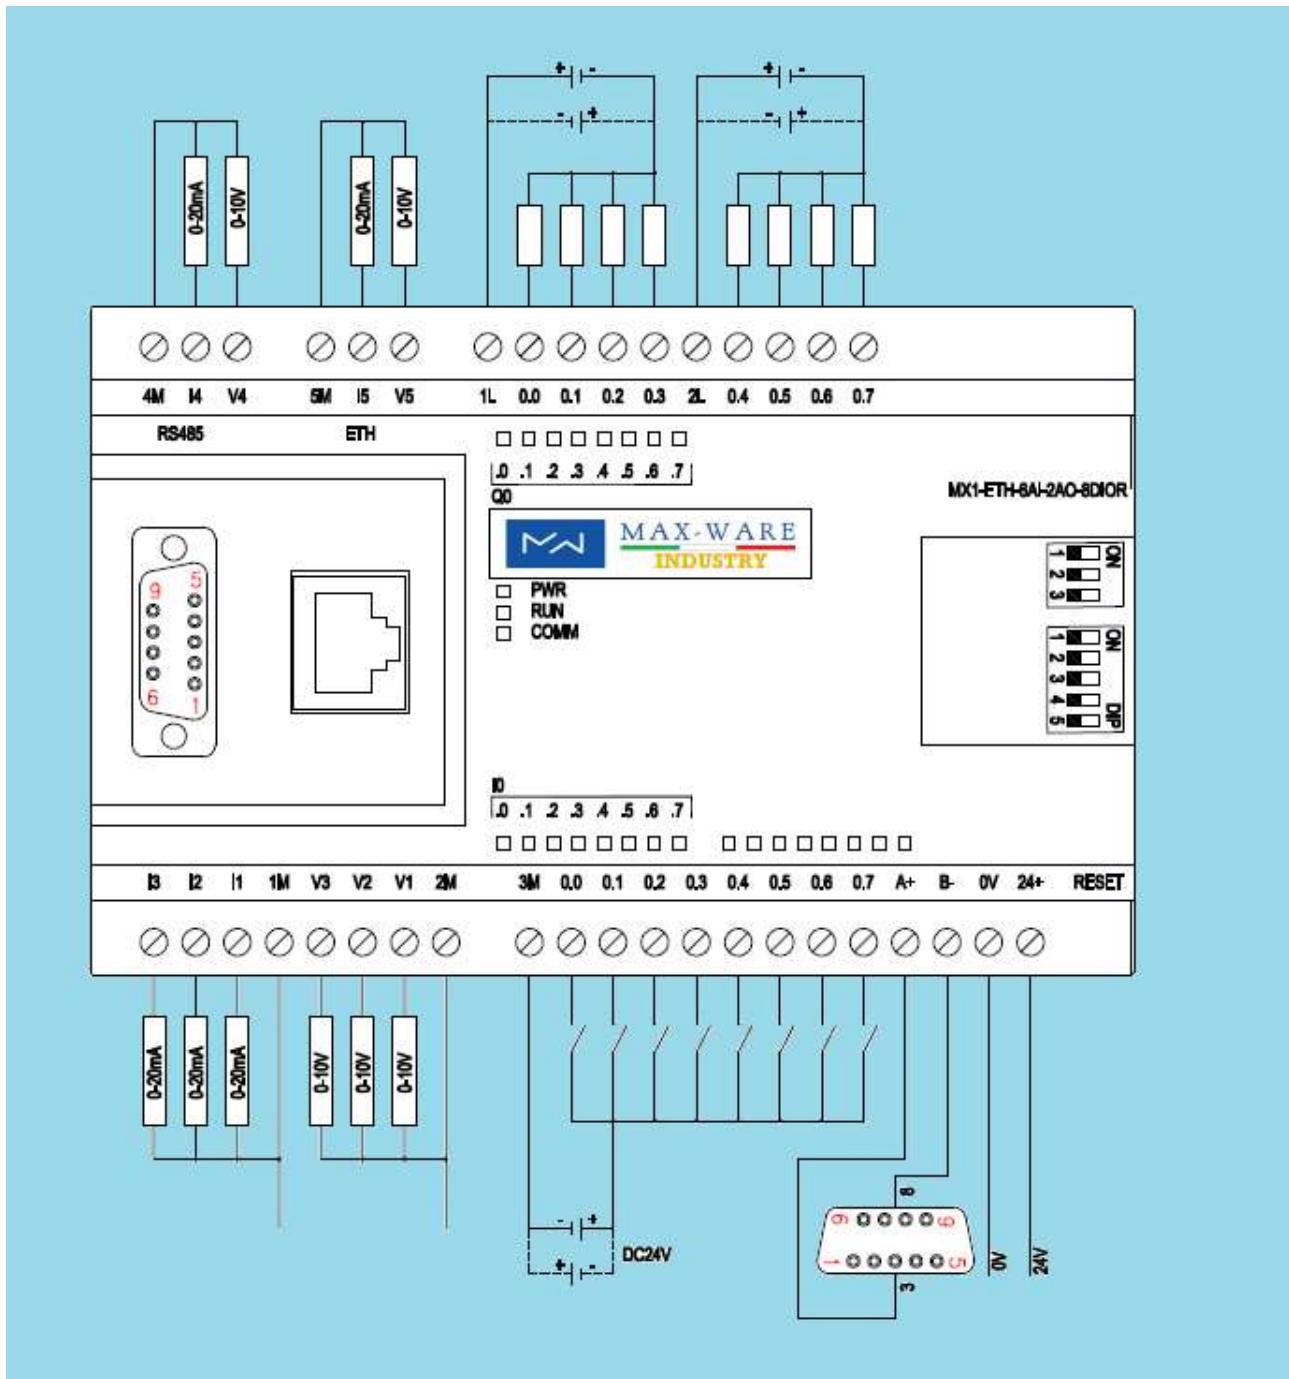

2 PRODUCT SPECIFICATION

DIGITAL INPUT	8 DIGITAL INPUT Switch contact signal or level signal (PNP or NPN) Effective range: dc 20-28 vdc Optocoupler isolation
DIGITAL OUTPUT	8 DIGITAL OUTPUT Relay output normally open contacts (PNP or NPN) Contact capacity: 30vdc/5A 250vac/5A Mechanical isolation
ANALOGIC INPUT	3 ANALOG INPUT 0-10V 3 ANALOG INPUT 4..20MA Conversion accuracy: 12bit (0-4096 INT)
ANALOGIC OUTPUT	2 ANALOG OUTPUT Type: 0-10v or 4..20ma Conversion accuracy: 12bit (0-4096 INT)
COM PORT 1	Type: RS485 2 wire A-B Baudrate: 4800-115200 (cfg) Communication format: Default 8-bit data, 1-bit stop, no check (cfg) Address range: 1-254 Trasmission distance: 1200m Communication mode: MODBUS RTU slave
COM PORT 2	Type: RS485 DB9 (3A+ , 8B- , 5ground) Baudrate: 4800-115200 (cfg) Communication format: Default 8-bit data, 1-bit stop, no check (cfg) Address range: 1-254 Trasmission distance: 1200m Communication mode: MODBUS RTU master
ETHERNET PORT	Type: RJ45 Local area network 10/100mbps, full duplex, adaptive Communication protocol: MODBUS TCP , TCP/IP Default ip address: 192.168.1.12
POWER	Operating voltage: DC 24V; with anti-reverse protection Power consuption: 2-4 W
TEMPERATURE	-20°C +70°C
DIMENSIONS	125MM (length) * 80MM (width) * 50MM (height)
INSTALLATION MODE	Guide rail DIN

4 COMMUNICATION FUNCTION

SERIAL PORT FUNCTION

PORT	SUPPORT FUNCTION	MAX CONNECTION	DESCRIPTION
COM 1	MODBUS TCP TO MODBUS RTU MODBUS RTU TO MODBUS TCP MODBUS RTU SLAVE TCP PASSTHROUGH	2	<p>When the host computer configures COM1 for TCP to RTU function, COM1 can be connected to other MODBUS RTU slave stations; realize Ethernet control of other MODBUS RTU slave modules (corresponding to port 502 of TCP connection).</p> <p>When the host computer configures COM1 for RTU function:</p> <ul style="list-style-type: none">1) When the received station number is the same as this module, other MODBUS RTU masters can access this device via MODBUS RTU protocol.2) When the received station number does not correspond to this module, other MODBUS RTU masters can access the MODBUS TCP server device via this module. <p>When COM1 is configured for the pass-through function, COM1 achieves data pass-through with the TCP connection on port 9503 (corresponding to port 9503 of the TCP connection).</p>
COM 2	MODBUS TCP TO MODBUS RTU MODBUS RTU TO MODBUS TCP MODBUS RTU MASTER TCP PASSTHROUGH	1	<ol style="list-style-type: none">1、 When the host computer configures COM2 for TCP to RTU function, COM2 can be connected to other MODBUS RTU slaves; to achieve Ethernet control of other MODBUS RTU slave modules (corresponding to TCP connection of port 9502/9503).2、 When the host computer configures COM2 for RTU function, other MODBUS RTU masters can access the device via MODBUS RTU protocol.3、 When COM2 is configured for the pass-through function, the TCP connection between COM2 and port 9502 is used for data pass-through (corresponding to TCP connection of port 9502). When configuring the MODBUS master function, COM2 can convert up to 6 MODBUS RTU slaves with this module to 1 MODBUS TCP server control corresponding to the number of IO and holding/input register points configured in their web pages via port 5502. (corresponds to TCP connection port 5502)

COM PORT FUNCTION

Port	MODBUS RTU Slave	MODBUS master to MODBUS TCP	MODBUS TCP to MODBUS	MODBUS RTU to MODBUS TCP	TCP to serial portpass-through
COM1	Support	Not supported	502	Support (websetting)	9503
COM2	Support	5502 Port	9502、9503	Not supported	9502

RECEIVE DATA LENGTH

PORT	TCP Transparent Transmission	TCP Transparent Transmission	MODBUS protocol	MODBUS protocol	MASTER function
	Receive data Maximum allowable length				Number of slave stations
COM 1	512	512	240	240	
COM 2	512	512	240	240	5
TCP	512	512	512	512	

MODBUS TCP FUNCTION

The MODBUS TCP function is accessed when the MODBUS TCP message address is the module address i.e. MODBUS TCP function

Category	Parameter details	Description
TCP server IP	192.168.50.99	This IP is the default value,
TCP server port	502、9502、9503	Fixed port
Module Address	1~126	Factory module station number 1, settable range 1~126

MODBUS TCP TO MODBUS RTU FUNCTION

Directly converts MODBUS TCP requests into MODBUS RTU requests and sends them to the slave via RS485 port; then converts the corresponding slave reply data into MODBUS TCP messages and sends them to the host computer, see the following table for the relevant parameters.

Category	Parameter details		Description
	COM1	COM 2	
TCP server IP	192.168.50.99	192.168.50.99	This IP is the default value
TCP server port	502	9502、9503	TCP server port 502 9502, 9503 fixed port, where port 502 can support up to 2 uplinks
Serial port mode	TCP 转 RTU	TCP 转 RTU	Serial port mode TCP to RTU
MODBUS RTU slave address	2~254	2~254	The MODBUS slave address connected to the RS485 port of the unit must be in the range 2~254 and not conflict with the module address
RS485 serial port parameters	Default parameters: Baudrate: 9600, 8 bits data without parity, 1 bit stopbit	Default parameter: Baudrate:9600, 8 bits data without parity, 1 bit stopbit	Serial port parameters

MODBUS RTU TO MODBUS TCP FUNCTION

COM1 port of this module supports conversion of MODBUS RTU messages to MODBUS TCP messages; it enables dataconversion between MODBUS RTU master and MDOBUC TCP server.

When the COM1 port is in "RTU" mode, the moduleautomatically starts MODBUS TCP client function and automatically connects to the remote MODBUS TCP server set up viathe web page.

The relevant parameters are described in the following table:

Category	Parameter	Details
	COM 1	
Remote ServerIP	192.168.50.124	The IP and port are the factory default parameters
Remote serverport	8080	The IP and port are the factory default parameters
Serial PortMode	RTU	serial port mode to RTU
RS485 serial port parameters	Default parameters: Baud rate: 9600, 8bits data without parity, 1 bit stop bit	Serial Port Parameters

MODBUS RTU FUNCTIONALITY

Both COM1 and COM2 ports of this module support MODBUS RTU function. When the COM1 or COM2 port is in "RTU" mode, the module can be used as a MODBUS RTU slave device. The relevant parameters are described in the following table:

Category	Parameter details	Description
MODBUSRTU Slave Address	1~126	The station number of this module can be set When COM1 port receives the same station number as this module, it will be treated as MODBUS RTU message; otherwise, MODBUS RTU message will be converted to MODBUS TCP, i.e.
Serialmode	RTU	the serial port mode to RTU.
RS485 serial port parameters	Default parameters: Baudrate: 9600, 8 bits data without parity, 1 bit stopbit	Serial Port Parameters

MODBUS TCP CONTROL MULTISLAVE

The COM2 port of this module supports MODBUS RTU master function, this function is used to convert up to 6 MODBUSRTU slaves connected to COM2 port and the number of IO points of this module into 1 MODBUS TCP server, which can be used for reading and writing of all slaves through 1 MODBUS TCP connection.

The module register address is the first (if the module address is 2-7 and the RTU station number "conflicts", it remains first), and the rest of the registers of lower stations are first.

Category	Parameter details		Description
Serial port number			COM2
TCP server IP	192.168.50.99		This IP is the default
TCP server port	5502		Fixed port
Module Address	1~126		Factory module station number 1, settable range 1~126
Remaining MODBUSRTU slave addresses	2~7		Remaining MODBUS RTU slave addresses 2~7
Maximum number of MODBUS RTU slave stations	6		This module is a MODBUS TCP server
Serial mode	MODBUS Master		Turning on the master mode for setting
COM2 serial port parameters	Default parameters: Baud rate:9600, 8 bits data without parity, 1bit stop bit		COM2 serial parameters should be modified, all slave serial parameters should be the same

After setting COM2 mode to MODBUS RTU master and configuring the corresponding slave points on the web page the module's COM2 will automatically start MODBUS RTU master timed scan.

5 RESTORE TO FACTORY DEFAULT

When the module is powered on and the RUN light is flashing, press and hold the reset button (about 5S) until the RUN light becomes normal and then release the button, the RUN light will be on for 5S and then resume flashing, then power off the module for at least 3S and power on, the module will restore the factory parameters, as shown in the table below.

Parameter Name	Parameter Default Value
IP address of the module	192.168.50.99
Module Address	Factory 1, DIP2 dip switch corresponds to station numbers 1~32
Serial communication parameters	Baud rate 9600, 8 bits of data, 1 bit of stop bit, no parity; The COM2 port baud rate is 9600 at the factory, and the DIP1 dip switch corresponds to the baud rate after use
Serial port mode	COM1, COM2 serial modes are MODBUS TCP to MODBUS RTU
Bus error mode	The mode is bus error reset, the time threshold for determining bus error is 2s
Remote server IP	address:192.168.50.124, port:8080
MODBUS TCP control Multi-slave communication configuration	The number of coil components, discrete components, read-only registers and read-write registers of "Station 1~Station 6" on the module IP is on webserver page
